

# Nützliches SQL

## doppelter join

Wir hätten gerne aus einer Tabelle nur die Zeile wo climate.date max ist, gruppiert nach climate.stations und wollen noch stations.name anzeigen.

```
<code sql> SELECT stations.lat AS lat, stations.lon AS lon, stations.name AS name, climate.tmk AS  
tmk FROM climate INNER JOIN (
```

```
SELECT climate.station, MAX(climate.date) AS date  
FROM climate  
GROUP BY climate.station
```

```
) AS c ON climate.station = c.station AND climate.date = c.date INNER JOIN stations ON  
climate.station = stations.id ORDER BY climate.station;
```
